This past weekend, Apple held its annual developer conference in San Jose, California. We're covering the keynote, and while we'll be sharing our thoughts throughout the week, we thought it'd be fun to start with a collection of funny jokes. iOS 5 is being built on the code name "Lion" (which is a lion's roar in British English) — the name was chosen after a comment about the OS's fast growth from a lions' roar. There are six things you should never do in an iPhone application: Ask the user to update their phone's firmware Ask the user to upgrade their phone's operating system Ask the user to upgrade their phone Ask the user to wipe the data on their phone Ask the user to make a payment Ask the user to subscribe to a list There are also, of course, seven core rules of application development: Never launch your app from a fixed URL Always include documentation and samples Always include a privacy policy Always include a license Always include a changelog Test your app on every platform Don't forget to add a splash screen Apple has been quoted by the Daily Mail as saying that Apple is "determined" to build a new iPhone each year, although it isn't "determined" to take too long. For developers at Apple, the iPhone might be like having triplets - everyone wants to play with it, but it's just not fair. Given that iPhones are becoming more like computers, the iPhone OS could be likened to a "Linux for the computer novice". In a distributed computing environment, programs are executed on each of a plurality of host computers (referred to as "computers" or "hosts"). Computer power, which is ultimately consumed by the hosts, can be significant in such a distributed environment. Accordingly, it is advantageous to be able to manage the computers in the distributed environment so as to conserve power, whether or not those computers are idle. As an example, all of the computers in a distributed environment may be powered-down in the event that none of them are currently in use. In addition, many servers, which are computers that are frequently idle, have a capability for conserving power by providing a power-down mode of operation. For example, a server computer may enter a power-down mode of operation when it has been dormant for a period of time. Thus
